

PROTECT YOUR PLUMBING FROM CONTAMINATION

Protect the integrity of the drinking water at your home or business by using a backflow prevention device on hoses or outdoor faucets.

Backflows can occur when there's a drop in pressure and water from an open hose and outdoor connection can flow back into your plumbing system.

A hose connection vacuum breaker, available at most hardware stores, is an inexpensive solution to backflows.

If you have any questions regarding backflow devices or would like more information, the Norfolk Utilities' Office of Cross Connections can help. Call 757-441-5774, extensions 262, 272 or 274, to learn more about how you can protect your tap water from backflow contamination.
